## Annex A <br> Fail-safe Tests

## A1. Under normal operating conditions, Inverter response time is less than 5s

| Test Procedure | Set user value to OW |
| :--- | :--- |
| Expected response | The power feed into grid should be reduced to 0W |
| Pass/fail criteria | Response time within 5s |

## Test procedure:

1. The machine is connected to the battery and the mains, and the load is connected in parallel to the mains.
2. Set the working mode of the machine to self use mode.
3. After the machine is running normally, the load values are set to $100 \%, 50 \%$ and $10 \%$ of the maximum output power respectively.
4. Turn off the load switch and switch from $100 \%, 50 \%$, and $10 \%$ power to 0 , respectively, to record the time required for the power to drop to zero.

- Test: Set user value to OW
- Scope: The yellow line is the load current, green shows current at output of AC current
- Reaction time: 3.9s
- Pass/fail: PASS
- Power: $100 \% \rightarrow 0$

## Agilent Technologies

Sat Sep 01 14:01:31 2018

- Test: Set user value to OW
- Scope: The yellow line is the load current, green shows current at output of AC current
- Reaction time: 3.45s
- Pass/fail: PASS
- Power:50\% $\rightarrow 0$

## Agilent Technologies

Sat Sep 01 14:02:27 2018

- Test: Set user value to OW
- Scope: The yellow line is the load current, green shows current at output of AC current
- Reaction time: 4.4s
- Pass/fail: PASS
- Power: $10 \% \rightarrow 0$

A2. Unplug communications cable between Inverter and Meter

| Test Procedure | Unplug communications cable between Inverter and Meter |
| :--- | :--- |
| Expected response | System turns off |
| Pass/fail criteria | System fails safe in less than 5 s |

- Test: Unplug communications cable between Inverter and Meter
- Scope: Yellow trace is RS485 communications from the Meter, green shows current at output of AC current
- Reaction time: 4.5s
- Pass/fail: PASS
